Abstract (en)

[origin: EP1552973A2] Control device for a motor vehicle actuator, especially a motor vehicle window lever has a computer unit for controlling the drive of the actuator. The computer unit is configured so that it will stop the actuator drive or start a process for stopping it if a signal corresponding to the drive torque exceeds a response threshold. It also designed to change the response threshold in response to a temporal or spatial change in the signal, i.e. if the rate of change of the signal increases, the response threshold will be reduced. The invention also relates to a window lever with a drive and an actuator mechanism, a digital storage medium and a computer program product.
