Abstract (en)

[origin: WO2004038148A1] The invention relates to an inlet brake for a rear opening hood of a motor vehicle and a rear opening hood opening device, said inlet break being designed for braking the opening movement of the rear opening hood once it has reached its open position, wherein a tube-shaped hinge clamp (3) of the rear opening hood is slowed down in a substantially U-shaped receiving element (4) by means of a clamping effect and is prevented from springing back, wherein the receiving element (4) is provided with conical, lateral brake cheeks (5) having a continuous conicity in the direction of opening so that a narrowing, clamping receiving element is formed.
