Abstract (en)
A device for absorbing a shock when a pivotable panel such as a door, a hatch or a window is closed against a frame edge, and for preventing rattling that results from play between said closed panel and said frame, which device comprises: a housing with a cavity, which housing is intended for fitting accommodation in a hole arranged for this purpose in said frame edge, which housing has on its front side an opening connecting to the cavity; a stop element which is slidable in lengthwise direction in this cavity and with a free end which is intended for pressure force-transferring co-action with the panel; spring means which press said stop element outward; and stop means determining the free, pressed-outward end position of the stop element. <IMAGE>
