Abstract (en)

[origin: WO2004033607A1] A heavy hydrocarbon composition with utility as a heavy hydrocarbon base stock comprising at least 95 wt.% paraffin molecules, of which at least 90 wt.% are isoparaffin, containing hydrocarbon molecules having consecutive numbers of carbon atoms, is a liquid at 100 °C, at which temperature its kinematic viscosity, as measured by ASTM D-445, is above 8 cSt, has an initial boiling point of least 850 °F (454 °C) and an end boiling point of at least 1000 °F (538 °C), wherein the branching index (BI), as measured by the percentage of methyl hydrogens, and the branching proximity ($\text{CH}_2 > 4$), as measured by the percentage of recurring methylene carbons which are four or more carbon atoms removed from an end group or branch, of said isoparaffinic hydrocarbon molecules, are such that: (a) $\text{BI} - 0.5(\text{CH}_2 > 4) < 15$; and (b) $\text{BI} + 0.85(\text{CH}_2 > 4) < 45$; as measured over the heavy hydrocarbon composition as a whole.
