Abstract (en)
[origin: WO2004042597A2] A method and a system (20) for electronic transmission of information data (28) are disclosed, in particular for information data in the form of print media material, comprising a hybrid transmission network (22), with at least one forwards channel (24), at least one interaction channel (25), at east one central processor unit (21) which at least temporarily cooperates with a data source (26) and at least one terminal (23), provided for a user of the system (20). The information data (28) is transmitted from the central processor unit (21) to the at least one terminal (23) by means of the at least one forwards channel (24) and the at least one terminal (23) interacts at least temporarily with the central processor unit (21) by means of the at least one interaction channel (25). According to the invention, the information data (28) is divided into two or more data blocks (29-33) and the data blocks are cyclically transmitted over the forward channel (24). Furthermore the information data (28) can be at least partly encoded and transmitted over the forward channel (24) and the encoded information data at least party decoded within the at least one terminal (23).
