Abstract (en)  
[origin: WO2004044810A1] A system and method for treating a biological fluid unit wherein the system ensures proper execution of the treatment by coordinating cooperation among a plurality of components operably connected to the system. The system includes a processor, a memory storing a blood product treatment module and being operably connected to the processor, at least one blood product treatment instrument for communicating information related to blood product treatment to the processor and memory over a communications network for treating a blood product, and, an interface having means for entering information, means for displaying information, and means for communicating with the processor and memory, the information being related to the blood product treatment. The processor, the memory, and the interface are for at least one of monitoring, managing, reporting, and administering the blood product treatment.
