Abstract (en)
[origin: EP1559455A1] The ski binding has a support plate assembly (4) with sliding support and bolt assemblies. A spring unit slides the support and bolt assembly after unlocking and with the support plate assembly stepped down into a position on a second bearing part (14) into bolted engagement with the facing end (8) where it is held in this position which lies between the release position and the at least one supporting position. The sliding support and bolt assembly is permanently spring tensioned towards the first bearing part (3) and is lockable in the release position against sliding in the active direction of the spring unit.
