Abstract (en)

[origin: WO2004025390A2] A current-reference circuit comprises a CMOS differential amplifier having first output node comprising a drain of a first n-channel MOS transistor and a second output node comprising a drain of a second n-channel MOS transistor. A first p-channel MOS transistor has a source coupled to a supply potential, a gate coupled to the second output node, and a drain. A first PNP bipolar transistor has an emitter coupled to the drain of the first p-channel MOS transistor through a first resistor and to a gate of the second n-channel MOS transistor, and a collector and a base both coupled to ground. A second PNP bipolar transistor has an emitter coupled to the drain of the first p-channel MOS transistor through a second resistor in series with a third resistor, and a collector and a base both coupled to ground. The gate of the first n-channel MOS transistor is coupled to a common node between the second and third resistors. A third n-channel MOS transistor has a drain coupled to the drain of the first p-channel MOS transistor, a source coupled to ground through a fourth resistor, and a gate coupled to either a reference potential or to the common node between the second and third resistors.
