Abstract (en)
A remote control device includes a casing (1) including a remote control circuit, a mechanical key (2) accommodated in an accommodating space (1d) in the casing so as to be capable of pivoting, and a cap (3) for preventing the mechanical key from moving out. The cap is engageable and releasable by sliding along an upper face of a base (1a). In the cap, a stopper (4) capable of reciprocating in the direction orthogonal to the direction that engages and releases the cap and a coil spring (5) for urging the stopper toward the upper face of the base are disposed. The cap is capable of being locked by making the stopper come into contact with a right side (S) of a projection (1b) formed on the upper face of the base so as to block movement of the cap in the direction that releases the cap. The cap is capable of being unlocked by moving the stopper from a contact position where the stopper is in contact with the right side to a position where the stopper is separated from the projection through the operation of a knob (4c) so as to allow the cap to move in the direction that releases the cap. <IMAGE>
