Abstract (en)

[origin: WO2004045934A2] The invention relates to a method for operating a hydraulic vehicle-braking system. Said method is characterised in that a hydraulic pressure is fed directly to a brake-master cylinder (11) via a hydraulic booster (7), which is connected upstream of said cylinder, and that the hydraulic pressure is regulated in accordance with a variable that represents the braking request of the driver. To achieve the latter, the pressure in the hydraulic booster (7) that is located upstream of the brake-master cylinder is regulated by controlling at least two valves (6) that are similar or that operate in a similar manner.
