Abstract (en)

[origin: WO2004048759A1] The invention relates a belt drive for auxiliary units in an internal combustion engine, provided with a friction gear (6) which is driven on the belt side and which is used to drive a separate ancillary unit (4). According to the invention, the friction gear (6) cooperates with the outer side of the belt (1) in a frictionally engaged manner in the contact area of a driving wheel (7) of the internal combustion engine or an auxiliary unit and is maintained in a permanent position of engagement with the drive wheel (5) and the belt (1) by means of a pivoting arm (9) which is mounted on an eccentric (8) which is arranged in a rotationally moveable manner on the machine side. The eccentric (8) of the adjusting device is rotationally driven as a result of a pre-tensioned spring (10) and acts upon the pivoting arm (9) in the direction of traction or pressure when the pretension of the spring is directed in a corresponding manner.
