Abstract (en)

[origin: FR2846769A1] The system includes a server having an image database (12) and image processors (12,20,25) for terminals adapted to convert these images into their respective formats compatible with remote terminals. The image database is a vectorial image database. The image-processing unit includes a scan assembly integrated with the vectorial image, and adapted to enable the manipulation of the images for making them compatible with remote terminals and units for generation of machine-readable images by these terminals from the manipulated images.
