Abstract (en)
[origin: DE10256410B3] The energy management method determines the priorities for at least 2 air-conditioning compressors in a first step (S1) and calculates corresponding air-conditioning regulation values, with determination of engine re-starting and engine idling or full load operation in subsequent steps (S2a,S2b,S2c), with regulation of the air-conditioning compressors when none of the latter apply. When one of the specified engine operating conditions is identified a further logic sequence is initiated in which the compressors are controlled in dependence on the assigned priorities.
