Abstract (en)

[origin: WO2004051130A1] The invention relates to a device for feeding a gaseous or liquid medium to a rotating pressurised system. Said device consists of a stationary sealing-head housing (1) comprising a connection opening (2) for the heat transfer medium, said opening leading into a connection conduit (2.1) that runs in the interior of the sealing-head housing (1). The device also comprises a tubular rotor (3) that is likewise situated in the interior of the sealing-head housing (1), is connected to the pressurised system and is mounted on the stationary housing (1) by means of at least one bearing (4), preferably an anti-friction bearing. The end of the connection conduit (2.1) is also equipped with a stator seal (5) and the end of the rotor (3) is provided with a rotor seal (6), both seals (5, 6) lying coaxially with the rotor (3) and abutting one another with their front faces. A thermally displaceable expansion element (7), located in the vicinity of the stator and rotor seals (5, 6), is directly responsible for carrying out a temperature displacement of the stator and rotor seals (5, 6) that lie axially opposite one another.
