Abstract (en)
[origin: EP1568839A2] The window or door has a window frame (12) swivellable around a vertical axis of rotation (16) and tiltable around a horizontal tilting axle. A corner of the door or window has a clamp in the intersection of the axis of rotation and the tilting axle (18) can move within a predefined range. In a closed position of the framework the window frame has an opening where corner has a clamp in the closed condition of the window or the door of the wing. The corner of the window frame has a connection port (34) where the corner clamp has a storage area (39) for the easement of the assembly of the framework at the window frame. The corner has a degree of freedom perpendicular to the axis of rotation and the tilting axle. The corner clamp has a second storage area which disconnects from the wing framework opposite the window frame permitting the regular use of the window. The storage direction is essentially perpendicular to the axis of rotation (16) and the tilting axle (18).
