Abstract (en)
[origin: EP1570888A2] The bar for a jump, for equestrian show jumping training, is a rod body (1) with an outer mantle (2) of a shock-absorbent material and an inner core (3), with end caps (4). The outer mantle is a sleeve with a wall thickness of at least 20% of the rod body diameter. The core is composed of alternating units (5,6) where one has bending flexibility and the other is relatively stiff against bending, to give the core a maximum bend of 20 mm under its own weight and at least 200 mm at the center when under a loading pressure, without a plastic distortion.
