Abstract (en)
[origin: EP1571268A1] The valve has a locking device that moves over an area of a fastener body without intervention of its fastener (80). A retaining cage (86) connects the locking device that moves with a retaining plate, which is arranged on a side of a mounting plate. A guiding medium of the retaining plate is formed across its passageway, which is designed as a conical drilling, in which segments of the locking device are movable axially.
