Abstract (en)  
[origin: EP1571633A1] The device has an elongated unit (6) presenting a support surface that is turned towards a reception surface situated adjacent to periphery of an opening frame. A fixing screw (11) maintains the elongated unit on the reception surface. A longitudinal capacitive detector (24) interposed between the two surfaces is subjected to capacitive variations when a distance between the two surfaces is varied and delivers a corresponding signal.
