Abstract (en)  
[origin: WO2004043304A2] The invention concerns an implant in the form of a compression-resistant hollow body (1), used in procedures for stiffening the vertebral column (2). The hollow body (1) consists of two open receptacles (3, 4) mutually oriented which interlock and form the implant proper (cage). The two receptacles (3, 4) can be separated by compression through insertion of a filling material, thereby producing an expansion of the hollow body (1) after it has been implanted.
