Abstract (en)

[origin: WO2004056605A1] The invention relates to a drive (1) for a vehicle-seat adjustment mechanism (3), comprising a manually pivotable drive lever (15), which can be displaced from a zero position in order to generate a targeted rotative motion of a driven element (63) after the coupling of one element (35) to a drive gear (51). The invention is characterised in that at least one sliding element (35), which is displaced in a translatory manner, is provided as the coupling element.
