Abstract (en)
[origin: FR2848767A1] The method involves recording a video sequence for recognizing a graphical unit in the video flow. A conditional marking time signal is generated when the graphical unit in the sequence is detected. The marking signal is associated with a part of the video sequence containing the graphical unit. The video sequence is synchronized with enriching functions according to the marking signal. Independent claims are also included for the following: (a) equipment for generating a synchronization signal in the video sequence (b) a process for conditional visualization of a video sequence.
