Abstract (en)  
The present invention of selective blocking device for drawers with improved anti-overturning system, is intended to prevent the moveable flange from adopting a position which impedes the closing of said drawer and allows the opening of any other drawer, for which it the moveable flange is provided with an additional arm which is a backward extension of the boss receiving arm of the interior guide, additionally the turning radius of the upper corner of the pulling flange has been enlarged, there being a window on the lower rail of the interior guide, moreover with the object of improving the braking and blocking of the drawer on its closure, an additional piece is fitted on the side of the small fixture, in which piece an additional boss fits mounted also on the interior guide. <IMAGE>
