Abstract (en)
[origin: WO2004054664A1] A snowboard binding comprises two fixing devices (2, 4) for the boot, which extend over both the front end and the rear end of the boot. The rear fixing device (4) comprises a stay (6), running transverse to the longitudinal direction of the boot, which runs in a first guide (5). A second guide (9) is embodied non-parallel to the first guide (5). A heel support (8) is arranged on the stay (6). The heel support (8) is forced along the two guides (5, 9) by pressing down on the stay (6) with the foot and the above follows a curved movement track, such that the heel support (8) is above the rear end of the boot in the locked position.
