Abstract (en)

[origin: FR2847188A1] The device (100) has a tray/cart (300) rotating around a tube (200, 202, 204) with a path of circular movement (400) placed on the circumference of the tube. The path of movement has two semi-tubular shells (402, 404) including spring clip (408). The spring clip enables the closure around the tube in a coaxial direction of the tube. A skid (500, 502, 504) sets the tube inside the closed shells. The movement path has points inserted in a hole to an inner surface on each side of skid. An Independent claim is also included for a procedure for work on tubes having different diameters.
