Abstract (en)

[origin: WO2004041663A1] The present invention relates to a package of packaging material comprising an at least partly cylindrical body section (1), a tapering shoulder section (2), a bottom section (5), as well as an opening arrangement (3). The sections of the shoulder section (2) which abut to those parts of the body section (1) which are of cylindrical form have been given a tapering form in that the packaging material is folded in a plurality of overlap folds (6) so that three circumferentially sequential sections of the packaging material are folded so that the first section forms the outside, the second section is folded inwards and backwards so that it abuts against the inside of the first section, and the third section is folded so that it abuts against the outside of the packaging material of the second section facing towards the inside of the package. The present invention further relates to a method of producing a package.
