Abstract (en)

[origin: WO2004055368A1] The invention relates to a high pressure pump which comprises a body (10) and at least one pumping element (10) which is arranged therein and provided a pumping piston (34) actuated by means of a transmitting element (28) in a reciprocating movement produced by a driven shaft (12) which is rotationally arranged in said body (10) by means of at least one bearing point (14, 16). Said drive shaft (12) comprises an eccentric segment (26) on which a transmission element (28) is rotationally arranged by means of a bearing point (30). Lubrication fuel is supplied to the bearing point (30) of the transmission element (28) on the eccentric segment (26) of the drive shaft (12) by means of a system of channels (54, 55, 57) therethrough.
