Abstract (en)

[origin: FR2849145A1] The process involves forming a conduit designed to form a series of end-to-end pipe sections. Each section is formed from a panel (3) having two longitudinal sides (31) separated by a set distance corresponding to the perimeter of the conduit. The conduit is formed by rolling the panel to form an overlapping tube (3'), having a diameter greater than that of the pipe section required, that is placed on a concrete support (4). The tube is then unwound so as to make the longitudinal sides (31,31') the correct level before they are joined to form a tube section (T).
