Abstract (en)

[origin: WO2004057544A1] The invention relates to a method and a device for sorting, counting and/or inspecting objects of a set of objects, especially of disk-shaped objects such as coins or the like. The device comprises an object separation device (10) for separating the objects of the set of objects. Once the separated objects have left the object separation device (10), they are transported along an object trajectory (12). Object acceleration means (22) accelerate the objects when they exit the object separation device (10). The device is further provided with object identification means (24) for identifying objects having different properties and means (14, 16, 18, 20) for specifically conveying the objects in accordance with one or more features of the objects. The object trajectory (12) furthermore carries air cushion-forming means (40).
