Abstract (en)

[origin: EP1577243A1] The device for the feeding of a pile containing individual material sheets to a further processing station includes a table (1), with a first (15) and second (14) section, and a feed slide (6). The second table section has a separating wedge (16) in the region of its end facing the first table section and orientated against the direction of feed of the slide. A vertical gap (17) can be formed between the facing ends of the table sections, and the pointed edge of the separating wedge is located on a higher level than the end of the first table section facing the separating wedge.
