Abstract (en)

[origin: FR2848581A1] The system has two profiles placed in a steel plate to reinforce angles between a slab surface and a joint plane. A jack has a screw to adjust the altitude of joint at every junction of a joint section. Assembly plates permits the transfer of vertical loads, and allows free movement along the x-axis and y-axis of two concrete slabs. A wire mesh with a fold is utilized for framing the slab sides.
