Abstract (en)

[origin: WO2004059591A2] Gate (1) comprising a vertical extended frame (2), at least one flap (3) which may be displaced between a closed position in which said flap prevents the passage of a person and an open position in which said flap permits said passage, means for reading an access ticket, means for controlling the displacement of the flap between the two positions, a lateral face to the frame (2), adjacent to the passage for the person provided with at least two rows of detector cells (C1-C33) cooperating with means for preventing the opening of the flap when said cells detect an abnormal situation, one row of which extends to both sides of the flap above a line (L) situated at the mid-height of the frame and the other row is located close to said line.
