Abstract (en)

[origin: EP1579932A1] A drivable device (5) is used to move the material (D) sideways out of the firing line (X-X) in a direction at right angles to the material length direction. The drivable device contains a guide channel acting as a firing channel (13) and at least one additional guide channel for receiving the material. The additional channel has at least one controllable braking device (18) for engaging with at least one length side of the material and a braking device for coaxial engagement with the material. A device is provided for ejecting individual pieces of braked material in the sideways direction. The drivable device is a round revolver with grooves evenly distributed around its periphery for acting as guide channels. Material is supplied continuously to the firing line.
