Abstract (en)  
The present invention relates to a slide mechanism for window regulators intended to mechanically connect the window regulator rail with the window pane by threading the window regulator rail so that it can slip through the same for the upward and downward movements. The configuration of the slide mechanism presents a minimum number of pieces and is conceived for connection to the window by means of a slotted pivot expandable by means of an expansion rivet. The configuration of the slide mechanism and of the slotted pivot with rivet assure a strong, secure and noise-free fastening. Use is made likewise of a latch which, during the installation of the window in the slide mechanism allows the temporary retention of the latter until the rivet assures the definitive fastening.
