Abstract (en)

[origin: EP1582812A1] The module (5) has a module cooling system formed of lower walls that are associated under combustion walls to form chambers in which cooling liquid e.g. water, circulates. Each chamber is formed between the corresponding lower wall and combustion wall. A movable part (51) pushing household waste is displaced in translation along an upper side (17) of a component (6) between retracted and deployed positions. An independent claim is also included for an installation for combustion of household waste, comprising a furnace provided with a grid constituted of several modules.
