Abstract (en)
[origin: WO2004061732A1] The present invention relates to a method and a server for responding to a request for access to an application service, which service is deployed in a system that associates specific areas of a position coded surface with corresponding application services. According to the invention, an enterprise paper look-up service E-PLS1 is provided which manages a confined set of enterprise application services E-AS1 associated with respective areas included by the overall position coded surface. When receiving a request that includes address information of such an area, the enterprise paper look-up service E-PLS checks if the area address is associated with a service that the E-PLS manages. If this is not the case, the request is routed to a second paper look-up service E-PLS2.
