Abstract (en)

[origin: EP1585072A1] The invention relates to a lollipop dispensing machine. The inventive machine consists of a display container (10) comprising numerous vertical channels (11) which are defined radially by a tubular wall (15) in order to house lollipops (CP), said lollipops being stacked such that the head (C) is disposed lower than the stick (P) thereof. The aforementioned display container (10) is mounted such as to rotate on the seat (57) of a base (50). In this way, a selected channel (11) can be positioned above a hole (51) which opens into a distributor device (60) that is controlled by a coin-operated selector (62). Each of the channels (11) comprises a retaining element (17) which is disposed at the lower end (16) thereof and which can be moved, by means of a member (63) that projects out from the distributor device (60), from a hold position, in which the lollipops (CP) are held in the channel (11) without resting on the above-mentioned seat (57), to a release position, in which the lollipops (CP) can pass through the hole (51). <IMAGE>
