Abstract (en)

[origin: WO2004063033A1] The invention relates to a pouring part (1) comprising a base plate (3), on which a neck (5) that surrounds the pouring opening is formed. The pouring opening is sealed by foil (23) that acts as a barrier and a lid part (9) that is mounted on the foil (23). The lid part (9) is connected to the neck (5) by radial connecting pieces (17). When the container is opened by pulling the tab (15), the flexurally resistant lid part (9) splits from the neck (5), tearing open the foil (23) lying below and thus exposing the entire pouring cross-section of the neck (5).
