Abstract (en)

[origin: WO2004066105A2] A system and method for composing, configuring, deploying, and managing services in a data processing system and data processing system network. This system provides deployment domains to define a logical set of business services that have similar requirements for an application infrastructure. A deployment domain is created, and a graphical user interface allows a user to compose, configure, deploy, and manage services within the deployment domain and associated hosts using a drag-and-drop interface. A system and method for distributing and updating services software in the network and configuring heterogeneous underlying web services hosting platforms is claimed.
