Abstract (en)

[origin: WO2004066234A1] The invention relates to methods and devices for securing a product against theft. The security device comprises a connection mode (110) and an on position mode (100). A receiver (6) of the security device is activated when in the on position (100) and the security device switches from the on position (100) to the connection mode (110) when the receiver (6) is impinged upon by a transmitter (5). The receiver (6) is deactivated in the connection mode (110). The energy consumption of the security device is reduced by deactivating (111) the receiver (6). The security device can be prevented from being unintentionally impinged upon by selection signals from the transmitter because of said deactivation (111).
