Abstract (en)

[origin: EP1586726A1] The mechanism has a pivoting locking unit (5) mounted at the level of an activating arm (30). The unit pivots between a locking position and an unlocking position of a handle (2), where the unit engages and disengages with a base (2), respectively. A helical spring (6) maintains the locking unit in the locking position. A knob (44) controls pivoting of the locking unit towards its unlocking position.
