Abstract (en)

[origin: US2005235464A1] In a device for the connection of an end part (5) of a band (1) to a rigid part (2), in particular a watchband to a watch casing, a pin (3) arranged at the end part (5) of the band (1) and extending, with its longitudinal axis, transversely to the longitudinal direction of the band (1) can be engaged with at least one recess (7) of the rigid part (2). In order to attach the band (1) to the rigid part (2)-even if said part has different shapes-with as little clearance as possible, the device is characterized in that the pin (3) is movable into different positions relative to the band (1) in a direction transverse to its longitudinal axis and can be fixed to the band (1) in these positions which it can assume relative to the band (1)
