Abstract (en)

A system for displaying an outcome on a gaming machine includes a display for displaying images of a game played on the gaming machine. A controller controls the display of the images on the display. The system further includes a simulation engine comprising a first part for imparting a simulation of at least one force acting on elements of the images so that the elements move as if in response to the at least one force and a second part which, on a selected element of the image, imparts a simulation of a different force so that the selected element behaves in a different manner to the remaining elements, the selected element having been selected by the controller as a part of the outcome. <IMAGE>
