Abstract (en)
[origin: WO2004073902A2] The invention relates to a device for transferring or threading beginnings of bands, especially very thin bands, from a band treatment or processing system to or into a system used for further treatment or a winding drum. Said device comprises a transfer table, the width of which corresponds at least to the width of a band that is to be conveyed and the surface of which is provided with a longitudinal slot in the direction of conveyance of the band, said slot being narrower than the minimum width of a band that is to be conveyed. The upper strand of a conveyor belt that revolves in the direction of conveyance of the band can be pivoted in a preliminary manner across the surface of the transfer table and can be temporarily connected in a positive manner to the band that is to be conveyed by means of the longitudinal slot.
