Abstract (en)
[origin: US2006138787A1] A folding lever closure which can be mounted in a thin wall has a cup-shaped housing whose cup edge terminates in a flange and which can be inserted up to the flange into an elongated opening, such as a rectangular opening, in the thin wall and can be fixed in this position by clamping devices, and within whose longitudinal walls a folding lever is mounted in such a way that it can be folded in, the gripping end of the folding lever being held in the folded in position by a locking lever which can be disengaged and which is arranged in the cup-shaped housing. The other end of the folding lever engages behind a frame part or the like and accordingly presses the thin wall against the frame part. According to the invention, the housing and, optionally, also the folding lever and locking lever, are parts which are injection molded from plastic and have flexible forward projections and/or rearward projections which are formed integral with these parts and which engage in rearward projections and/or forward projections of the other respective part, in which they are supported and/or held, or engage in the back side of the thin wall.
