Abstract (en)
This invention relates to a firearm targeting device (1) comprising a support frame (3) mounting a plurality of targets (5(a) - 5(e)) thereon. Each of the targets is moveable to and from a first substantially upright targeting position and a second substantially horizontal shot position. The firearm targeting device (1) is provided with means to automatically return the targets from a shot position to a targeting position. By having means to automatically return the targets to a targeting position, the safety of the marksmen using the firing range is improved as there is no longer any need for the users to go out onto the firing range to replace their targets. The particular construction described is robust and cost effective to manufacture and may be disassembled to allow replacement or repair of parts. <IMAGE>
