Abstract (en)
[origin: EP1594099A1] A security sensor assembly comprises an infrared beam detecting element (5) for detecting infrared rays of light coming from an intruder, a cover (6) for covering a front area forwardly of the infrared beam detecting element (5), a light transmitting element (11) for transmitting an obstructor detecting beam (L1) towards the cover (6), a light receiving element (12) for receiving a secondary beam (L2) of the obstructor detecting beam, which is reflected from or passed through the cover (6), a check circuit (24) for checking a receiving level of the light receiving element (12) at intervals of a predetermined period, and a first adjusting circuit (20) operable, when a received level of the secondary beam (L2) approaches an obstructor detecting threshold value, to adjust the received level so as to depart from the obstructor detecting threshold value. <IMAGE>
