Abstract (en)  
[origin: WO2004067154A1] The invention relates to a method for producing a porous ceramic composite, which is characterized by applying a green layer to an already sintered ceramic substrate and sintering it together with the already sintered substrate at temperatures ranging from 500 DEG C to 1300 DEG C. The green layer exclusively contains ceramic particles having a particle size  $x \leq 100$  nm and the sintered green layer being the functional layer has a layer thickness  $s \leq 2.5$   $\mu$  m. The functional layer produced according to the inventive method is flawless and fine-pored and is therefore especially suitable for filtration processes.
