Abstract (en)
[origin: EP1596007A1] In an asphalt paver in which on a base paver provided with a base conveyor for conveying and supplying paving materials onto an applied surface, either an attachment for laying a single layer or that for laying multiple layers is selectively mounted, a hopper for upper layer constituting the attachment for multiple layers is provided with a pair of left and right buckets, each having a substantially trapezoidal cross-section, the buckets being openably and closably supported by a support shaft extending in a longitudinal direction of a vehicle body and having an upper portion, respectively, permitted for being folded. Thus, the capacity of the buckets can be increased by extending the upper portions from the folded position thereof. When the buckets are opened and when the upper portions are folded, the overall height of the asphalt paver can be lowered to thereby reduce such an anxiety that the paver might interfere with any lower face of a structure such as a bridge during the conveyance of the paver. <IMAGE>
