Abstract (en)

[origin: WO2004073426A1] Filter tips are applied to cigarettes by a device equipped with a conveying roller (9) on which assemblies (4) composed of two cigarettes (5) and a double length filter plug (6) placed between them are united with tipping papers (11), also with a flexible rolling conveyor (12) looped around first and second pulleys (16, 18) and combining with the roller (9) to create a concave channel (13) along which a tipping paper is rolled around the relative filter. The rolling surface of the flexible conveyor (12) is faced with metal cleats (24) ordered transversely one beside the next. To ensure that the conveyor (12) runs concentrically with the roller (9) and maintain a constant depth along the channel (13), the device is equipped with magnets (30) and guide wheels (33) positioned on the side of the flexible conveyor (12) opposite from the channel (13) in such a way that the magnets (30) will interact with the cleats (24) and with blocks (26) and screws (27) by which the cleats are clamped to the conveyor (12).
