Abstract (en)

[origin: WO2004063466A1] Disclosed is a track support for magnetically levitated railways, comprising a supporting framework that extends in the direction of travel, rests on bearings or props, and is provided with system components which are arranged thereupon and support and guide a vehicle. According to the invention, the system components are part of a track that is placed upon the supporting framework. Also disclosed is a production method for said track support that is made of standardized parts and can thus be produced and assembled in an inexpensive manner.
